Claim 2; Fig 1; 58pp; English.
DNA encoding the water-soluble polypeptide with a high affinity for IFN alpha and beta is isolated by PCR, using appropriate oligonucleotides as primers and cloned cDNA as template. For example, bacteriophage lambda ZAP, containing the entire coding sequence of the IFN alpha and beta receptor (030533), was incubated with oligos 030534 and 030535. R28496 represents the complete receptor. R28495 lacks the transmembrane and cytoplasmic domains. Both forms bind IFN in the same way as antibodies so are immunosuppressants e.g. for treating autoimmune diseases and graft rejection. They lack the
Compsn. of monoclonal antibodies against interferon useful as immuno:modulator, eg. for treating AIDS Disclosure; Fig. 2A-2B; 105pp; English.
A recombinant soluble form of the human interferon c protein extracellular domain, given in R71723, was e

Disclosure; fig 4; 30pp; French.
This recombinant human alpha interferon (IFN) receptor protein is useful for the testing of IFN agonists and for treatment and diagnosis of viral diseases and tumours. Antibodies raised against this protein can be used for blocking the receptor when required, eg where overexpression of alpha-IFN is harmful. The Abs are also useful for eg drug targetting. Variants of the protein, having residues 164 (Thr.) replaced by Arg and an Asp inserted between residues 479 and 480, are also useful.
                                                                                                                                                                                                                                                                                           20-OCT-1989; FR-013770.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New water-soluble polypeptide(s) with affinity for IFN-alpha and beta - used to treat e.g. lupus erythematosus, Behcet's disease, aplastic anaemia, diabetes mellitus, rheumatoid arthritis, etc. Disclosure; Page 47; 52pp; French.

The invention covers derivatives of the interferon-alpha and/or beta receptor obtained by deleting the transmembrane and cytoplasmic domains of the native receptor or by substitution. Potentially immunogenic epitopes are eliminated and the deriv. can be secreted from transformed cells. Soluble deriv.s block the activity of IFN alpha/beta and can be used to treat autoimmune diseases or to inhibit graft rejection. See also Q14239.

Mater soluble polypeptide(s) strongly bind interferon(s) alpha and beta useful as immunosuppressants, for treating auto:immune pr and beta useful as immunosuppressants, for treating auto:immune pr diseases and transplant rejection soluble polypeptide with a high affinity for Claim 3; Fig 2; 58pp; English.

CLAIM 3; Fig 2; 58pp; English.

CLAIM ancoding the water-soluble polypeptide with a high affinity for DNA encoding the water soluble polypeptide with a high affinity for CLAIM as template. For example, bacterlophage lambda ZAP, containing the entire coding sequence of the IFN-alpha and beta receptor (Q30533), was incubated with oligos CLAIM and Q30535. R28496 represents the complete receptor. R28495 clacks the transmembrane and cytoplasmic domains. Both forms bind CLAIM in the same way as antibodies so are immunosuppressants e.g. for treating autoimmune diseases and graft rejection. They lack the CAIM is side-effects of known immunosuppressants such as steroids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

Monoclonal antibodies produced against soluble forms of the human interferon alpha-beta receptor based on the full-length human IFN-R sequence are claimed. The antibodies are useful for treatment and prophylaxis of disorders involving cell proliferation and/or viral infection.
                                                                                                                                                                                                                                                                                                                                                        Compsn. of monoclonal antibodies against interferon receptor useful as immuno:modulator, eg. for treating AIDS Disclosure; Fig.3A-2B; 105pp; English.
The amino acid sequence of human interferon class I receptor is given in R75356. A recombinant soluble form of the extracellular domain of this receptor (R71723) has been used to raise immunomodulatory monoclonal antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (EUBI-) LAB EURO BIOTECHNOLOGIE Benizri EJ, Tovey MG; WPI; 95-131187/17.

                                                                                                                                                                                                                                                                           IFNAR (W21804). There is no transmembrane domain. The amino acid sequence is predicted from a cDNA clone (see also T73520) obtd. from human myeloma U266 cells. Soluble, non-membrane bound IFNAR splice-deleted forms 1 and 2 (see also W21805) probably regulate the response of human cells to IFNA, either by acting as IFN antagonists or by regulating the activity of the multiple IFN subtypes. They can be expressed in host cells and used to inhibit, modulate or modify the activities of IFNs alpha and beta in cells, tissues and organisms, or for diagnostic purposes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel splice deleted interferon alpha-receptor (IFNAR) form 2 (W21806) is characterised by a double deletion when compared to transmembranal IFNAR (W21804). The extracellular domain is shortened by 6 amino acid residues and is followed by a truncated intracellular domain. There is no transmembrane region. The amino acid sequence is predicted from a CDNA clone (see also T73521) obtd. If from human myeloma U266 cells. Soluble, non-membrane bound IFNAR splice-deleted forms 1 (see also W21805) and 2 may regulate the response of human cells to IFNS, either by acting as IFN antagonists or by regulating IFN activities. They can be expressed in host cells and used to inhibit, modulate or modify the activities of IFNs alpha and beta in cells, tissues and organisms, or Sequence 496 AA;

Human transmembranal interferon alpha receptor (IFNAR) (W21804) includes a 21-amino acid transmembrane region. Novel, splice-deleted IFNAR forms 1 (W21805) and 2 (W21805) have been detected that lack this transmembrane membrane. Soluble non-membrane bound polypeptides can be expressed in host cells and used to inhibit, modulate or modify the activities of interferons alpha and beta in cells, tissues and organisms, or for diagnostic
rejection

Claim 2; Page -; 79pp; English.

This sequence is the human CRFB4 sequence, DNA encoding it is used in the recombinant DNA (I) of the invention. (I) comprises a sequence (S1) encoding the interleukin-10 (IL-10) receptor (IL10R) and a sequence (S2)

A vector containing (I) is used to restore, e.g. by gene therapy, II-10 sensitivity to a cell that expresses a dysfunctional IIIOR and is able to bind II-10 but not to transduce a signal. Antisense CRFB4 sequences (especially ribozymes), can inhibit III-10 activity in cells. Antibodies specific for CRFB4 are used to measure and localise CRBF4, for diagnosis of defective II-10 activity. Fragments of (I) are used as primers or probes to assay CRBP4-specific RNA. Agonists/antagonists may be administered parenterally, orally or rectally especially by intravenous injection or directly into a tumour or

Cells containing (I) may be used to identify agonists/antagonist of IL-10. Agonists are potentially useful, e.g. for preventing allograft rejection, as vaccine adjuvants, for treatment of photosensitivity, inflammation, autoimmune disease and septic shock, while antagonists are potentially useful for increasing immune responses against tumours, viruses, bacteria and parasites (especially intracellular pathogens) and

                              PT Novel human 2cytor7 DNA encodes a type 2 cytokine receptor - useful profit treating renal, neural, pancreatic and prostatic diseases PS Claim 1; Pages 55-59; 72pp; English.

CC This represents the Zcytor7 cytokine receptor Zcytor7 is a ligand-complete of the complete of the type 2 cytokine complete of the cytopeptide and is a novel member of the type 2 cytokine complete of the cytopeptide and is a novel member of the Zcytor cytokine complete of the cytopeptide and intracciption promoter, a sequence complying a transmembrane and intracellular domain, or both, and a cytopeptide are combinant production of the polypeptide. The sequences can be used to study the Zcytor7 gene and to isolate ligands binding to it. Zcytor7 is complete the cytor and cytor in the kidney, pancreas, prostate or nervous complete thation of cell in these organs. The antagonists and agonists can complete complete complete complete complete can be used to stimulate proliferation and complete complete can be used in the treatment of renal, neural, pancreatic and prostate complete complete can be used in the treatment of renal, neural, pancreatic and prostate complete can be used in the treatment of renal, neural, pancreatic and prostate complete can be used in the treatment of renal, neural, pancreatic and prostate can discount the can be used to stimulate proliferation and complete can be used to the can b
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Suppressing tumours in mammals with accessory factor 1 (AF-1) - for interferon gamma, specifically induction of class I HLA antigens, including use of AF-1 DNA in gene therapy Disclosure; Fig 21A; 114pp; English.

The sequence is that of human interferon-gamma accessory factor-1. Incorporation of AF-1 into immune and tumour cells re-establishes normal function with elimination of malignant cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           R71035;
11-OCT 1995 (first entry)
Human IFN-gamma accessory factor-1.
Interferon-gamma; AF-1; tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Homo sapiens.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
